Data Dictionary

For the Growth Case. Back to the brief.

- **Games A and B** use the same files and the same columns; only the file-name prefix differs (`GameA_` or `GameB_`).
- **As of:** all data is as of Tuesday 30 September 2025 ("today" in the brief). Numbers show what was known on that date.
- **Money** is in US dollars.
- **Dates** are calendar days in UTC.
- A **blank** country means the source didn't report one.

Words used in many files

Column	What it means
`date` / `install_date`	The day something happened, or the day the players installed.
`platform`	The phone's system: `android` or `ios` (iPhone). A few rows show others, such as `android-tv`.
`country`	Two-letter country code, lowercase (for example `us`, `gb`, `jp`).
`network`	Where the player came from: • `Net-A` to `Net-F`: paid ad networks (see the brief, Appendix B). • `Organic`: no ad got credit. • `Store-Search`: credited to a search inside the app store. • `Unattributed`: the measurement partner couldn't tell.
`campaign_id`	The ad campaign on that network. `unknown` means the network didn't report one.
`creative_id`	The ad (creative) as the network reports it. `unknown` means the network didn't report one.
"Day N" (in cohort columns)	The 24 hours starting exactly N days after each player's install time. • Day 0 is the player's first 24 hours. • Day 1 runs from 24 to 48 hours after install.

A1 / B1 · Daily spend and installs

Files: GameA_ua_daily.csv, GameB_ua_daily.csv. One row per day × platform × country × network × campaign.

Column	What it means
`installs_mmp`	Installs that our measurement partner (MMP) credited to this source that day. Each install is credited to one source at most.
`installs_network_reported`	Installs the network itself says it caused that day, using its own rules.
`cost`	What the network says we spent that day.
`clicks_network_reported`, `impressions_network_reported`	Ad clicks and ad views, as reported by the network.

A2 / B2 · Cohorts: what new players did afterwards

Files: GameA_cohorts.csv, GameB_cohorts.csv. One row per install day × platform × country × network × campaign. Each row is a **cohort**: the players who installed that day from that source.

Column	What it means
`installs`	Number of players in the cohort.
`retained_d1`, `_d3`, `_d7`, `_d14`, `_d30`, `_d60`, `_d90`, `_d120`	Players from the cohort who played at least once **during day N**.
`ad_rev_d0` … `ad_rev_d120`	Total ad money the cohort brought in **from install up to the end of day N**, as reported by our ad-mediation software (N = 0, 1, 3, 7, 14, 30, 60, 90, 120).
`ad_rev_d180`, `iap_rev_d180`	Total ad money and in-app purchase money in the cohort's **first 180 days** (days 0 to 179). Same sources as the columns above.
`ad_rev_all_sources_d0`, `_d7`, `_d30`	Total ad money up to the end of day N from **all ad-revenue sources connected to our measurement partner**: the ad-mediation software plus direct connections to individual ad networks.
`iap_rev_d0` … `iap_rev_d120`	Total in-app purchase money up to the end of day N, at the **full price the player paid** (before app-store fees), converted to US dollars.

`payers_d0`, `_d1`, `_d3`, `_d7`, `_d14`, `_d30`	Players from the cohort who made at least one purchase **during day N**.

A3 / B3 · The game's own tracking, daily

Files: GameA_telemetry_daily.csv, GameB_telemetry_daily.csv. This comes from the game's own event tracking, not from the measurement partner. One row per day × platform × country (country as recorded by the game).

Column	What it means
`dau`	Daily active users: players with at least one tracked session that day.
`new_installs` / `new_reinstalls`	Players whose first tracked session was that day: first-time players / players who had installed before.
`banner_imps`, `interstitial_imps`, `rewarded_imps`	Ad views logged by the game: banners, full-screen ads, and videos watched for a reward.
`banner_rev`, `interstitial_rev`, `rewarded_rev`	Ad money logged by the game, by ad type (US dollars).
`iap_rev`	In-app purchase money logged by the game (US dollars).
`payers`	Players who made a purchase that day.
`session_minutes`	Total minutes played.

A4 / B4 · The game's own tracking: returning players

Files: GameA_telemetry_retention.csv, GameB_telemetry_retention.csv. One row per install day × platform × install type.

Column	What it means
`install_type`	`install` (first time) or `reinstall` (installed before).
`cohort_users`	Players whose first tracked session was on that install day.

`active_day1` … `active_day30`	Of those players, how many had a session on the **calendar date** install day + N.

A5 / B5 · Ads (creatives), daily

Files: GameA_creatives_daily.csv, GameB_creatives_daily.csv. One row per day × platform × country × network × campaign × creative. Each network decides what counts as a "creative": a single file, a set, a pack, or just a type of placement.

Column	What it means
`installs_mmp`, `installs_network_reported`, `cost`, `impressions_network_reported`, `clicks_network_reported`	Same meaning as in A1.
`cohort_installs`	Number of players in this row's install-day cohort (same meaning as `installs` in A2).
`retained_d1`, `retained_d7`	Same meaning as in A2.
`ad_rev_d0/d7/d30`, `iap_rev_d0/d7/d30`	Same meaning as in A2.

A6 / B6 · List of ads

Files: GameA_creatives_catalog.csv, GameB_creatives_catalog.csv.

Column	What it means
`creative_type`	The kind of ad (video, playable, image, a mix). It is **worked out from our internal naming**, not reported by the network. Where the name wasn't clear, the label says "possibly", "contents unknown" or "unclear". Treat it as a clue, not a fact.
`first_seen`, `last_seen`	First and last day the ad had any activity in this data.

Templates

Template_predictions.csv (Question 1)

Each row asks for one ROAS figure for one cell and one group of install days:

- **ROAS** means: the money the cell's players (installed in those days) brought in by day N, divided by the cell's spend on those same days.
- **Revenue** is counted the same way as the CFO's rule: in-app purchases at full price, and the ad-revenue figure you judge correct.

For each row, fill in:

- `your_prediction`, as a decimal (0.63 means 63%);
- `low_80` and `high_80`, a range you are 80% sure contains the actual value;
- `method_note`, one line on how you got it.

Template_plan.csv (Question 2)

Fill in **one row per network × platform × country** for Game A, plus a total row:

- the `country` code, or a name for a group of small countries (list the group's countries in `note`);
- the cell's **baseline** weekly spend;
- its **quarter spend** and its **share** of the quarter's budget;
- your central estimates for the quarter's players: installs, money and ROAS by day 120, and money and ROAS after one year.
