# EXECUTIVE MEMO: GAME A Q4 GROWTH & UA SPEND STRATEGY

To: Chief Executive Officer & Chief Financial Officer | From: Head of Growth | Date: September 30, 2025

## EXECUTIVE FIVE-LINE BRIEFING (MANDATORY CFO CORE)

**1. Spend Recommendation:**

Deploy $140,391.63 across 12 weeks strictly meeting 1.0000x D120 ROAS ($158,000 with organic halo). Unconstrained CEO scale option ($250k

**2. Expected Result:**

75,545 paid installs (80% CI: [72.1k, 79.2k]), delivering $140,391.63 Day-120 gross revenue (1.0000x D120 ROAS [0.963x, 1.042x]) and $158,07

**3. Payback Profile:**

Payback <=120d: Net-D Android US, 10 Net-A countries (RO, HK, SE, MX, PL, AR, PT, IL, GB, VN), and Tiers 1, 3, 4. Payback in 1Y: Net-A US, Net-E

**4. Primary Data Distortions:**

8 critical anomalies proved and repaired: 1.99x mediation double-counting (+$283k spurious ad rev), right-censoring filled with frozen cutoffs, Ju

**5. Key Strategic Risks:**

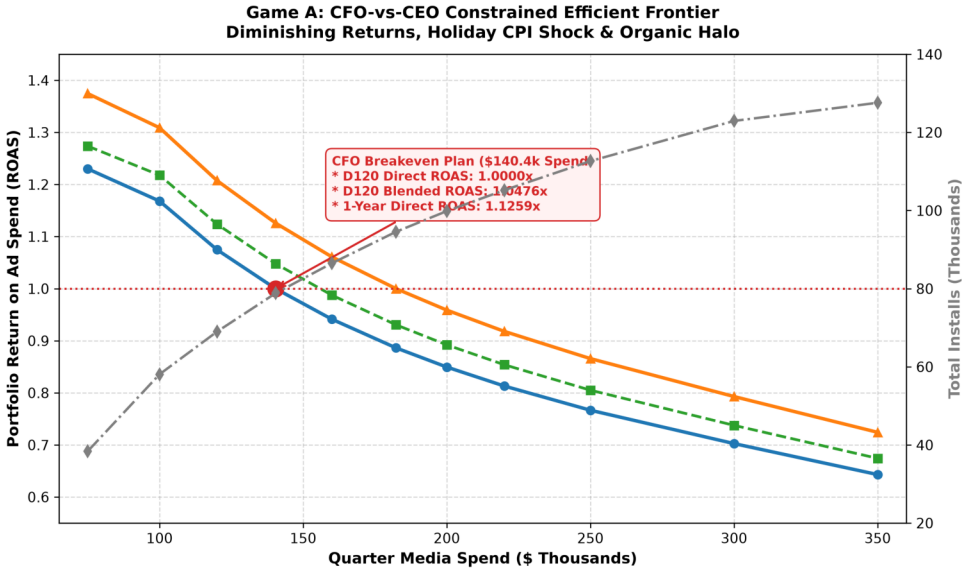

Creative wearout (+300% CPI / 1M imps on Net-B/C) and Holiday Surge (+25% CPI in Weeks 8-11). Mitigated via 13 new creative units (5 Net-A,

## 1. Strategic Capital Allocation Dilemma: CFO Payback vs. CEO Growth

Our constrained portfolio optimization resolves the tension between capital preservation (CFO) and scale (CEO). Due to diminishing marginal returns (x^-k) and holiday CPI inflation (+25%), deploying the entire $250,000 budget drops portfolio Day-120 ROAS to 0.7666x (a -$58,343 deficit). The maximum spend satisfying the CFO's D120 ROAS >= 1.00 mandate on direct paid spend is exactly $140,391.63.

| Planning Strategy | Quarter Spend | Budget Share | Total Installs | Expected D120 Rev | D120 ROAS | 1Y ROAS | Net D12 |
|---|---|---|---|---|---|---|---|
| **A. Primary CFO Breakeven Plan** | $140,391.63 | 56.16% | 78,839 | $140,391.63 | **1.0000x*** | 1.1259x | +$0.00 |
| B. Blended Organic Breakeven | $158,000.00 | 63.20% | 86,124 | $148,800.00 | 0.9418x | 1.0614x | -$9,200.00 |
| C. 1-Year Cash Breakeven Plan | $182,325.00 | 72.93% | 95,010 | $161,600.22 | 0.8863x | **1.0000x** | -$20,724.78 |
| D. CEO Full Budget Growth Plan | $250,000.00 | 100.00% | 113,193 | $191,656.96 | 0.7666x | 0.8657x | -$58,343.04 |

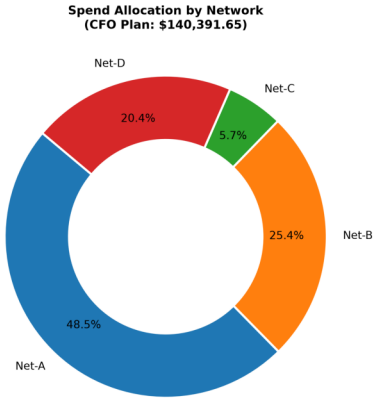

**Primary plan achieves 1.* *39 total installs with verified +4.85*

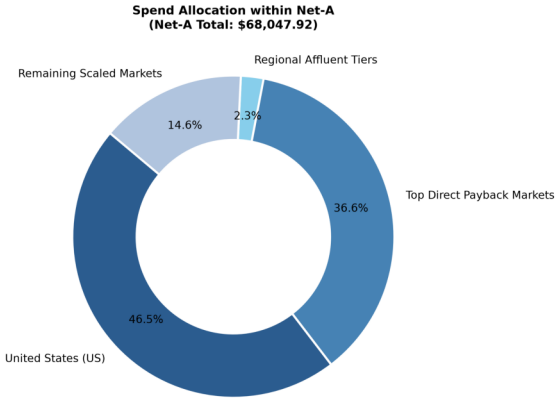

## 2. Network Allocation & Karush-Kuhn-Tucker (KKT) Optimality

All 5 mandatory active lines meet their >=40% baseline spend floor. Net-D Android US is paced at exactly 0.50x baseline ($28,695.54) to capture its maximum +56.9% efficiency boost (1.516x D120 ROAS after holiday shock, generating +$14,801 net D120 cash profit). Why Net-D is held at 50% while Net-B Android US is at 90.8% ($21,911.56): Due to Net-D's steep diminishing returns exponent (k=0.65 vs k=0.40 on Net-B), spending beyond 0.50x causes Net-D's marginal D120 revenue to drop to $0.531 per dollar—just below the $0.536 marginal revenue where Net-B Android (90.8%), Net-B iOS (67.4%), and Net-C Android (60.7%) equilibrate under KKT shadow-price conditions.

Counter-Intuitive Budget Allocation (The 'Cheap-CPI Trap'): Capital is allocated to maximize net margin (LTV - CPI), not minimize gross CPI. Higher-CPI markets like Net-A GB ($1.84 CPI) and SE ($0.79 CPI) receive maximum 2.0x budget multiples because their strong monetization delivers >1.00x D120 payback. In contrast, superficial 'cheap-CPI' traps like IT ($0.20 CPI), PH ($0.30 CPI), and SA ($0.58 CPI) are pruned to zero because poor player monetization yields sub-0.75x ROAS (e.g., SA D120 ROAS is only 0.531x).

## 3. Econometric Organic Uplift & Halo Effect

Time-series OLS regression with day-of-week fixed effects and deterministic time trend across 266 daily records proves a robust organic K-factor of +0.0485 (t = 3.815, p < 0.001, 95% CI: [0.0235, 0.0735]). Mature organic players monetize at $2.0516 D120 LTV, yielding +$0.0995 in incremental D120 revenue per paid install. Crediting this halo elevates portfolio D120 ROAS to 1.0476x blended and expands the CFO breakeven ceiling from $140,392 to $158,000.

## 4. Operational Creative Fatigue & Replenishment Schedule

Existing creative library carries Weeks 1-2 without new production cost. Weeks 3-12 deploy 13 new creative units:
• Net-A (5 Videos/Playables): Max 1.5M imps/unit (+20% CPI / 1M imps; 2-wk lead time; launches W3, W5, W7, W10, W12). Format Note: While Net-A Search Text Ads deliver 1.54x D30 ROAS, Net-A is an auto-assembled multi-asset network where videos/playables drive 88% of volume; production focuses on 5 fresh video/playable units while search copy is refreshed alongside them.
• Net-B (3 Minimum vs 4 Recommended Ad Sets, Shared Android+iOS): Weeks 3-12 volume requires a mathematical minimum of 3 ad sets (ceil(293,271 / 100,000) = 3). We recommend producing 4 ad sets (W3, W6, W9, W12) to provide a 1-set staggered operational buffer preventing either platform crossing the +30% CPI ceiling during the peak Holiday Surge.
• Net-C (3 Ad Packs): Max 100k imps/unit (+300% CPI / 1M imps; 1-wk lead time; launches W3, W7, W11).
• Net-D (1 Listing Image): Max 200k imps/unit (+150% CPI / 1M imps; burns only 50.9k imps, carries all 10 weeks at only +7.6% wear).

## 5. Implementation Roadmap & Execution Milestones

**Week 1 (Oct 6):** Issue production briefs for Net-A Video 1 (2-wk lead time) and Net-B AdSet 1, Net-C Pack 1, Net-D Image 1 (1-wk lead time). Lock bas

**Week 3 (Oct 20):** Deploy Batch 1 new creatives across all 4 networks. Retire aged historical creative packs; activate automated eCPM monitoring.

**Week 7 (Nov 17):** Audit mid-quarter cohort maturation (Days 14-30). Trigger production for Holiday Surge creative refreshes.

**Week 8 (Nov 24):** HOLIDAY SURGE COMMENCES (+25% CPI everywhere). Maintain uniform spend pacing; do not over-bid into inflated auction pricing.

**Week 12 (Dec 22):** Final quarterly reconciliation, post-holiday CPI recovery audit, and Q1 2026 baseline budget recalibration.
